CPEN 208 — Project 1

Relational Database & Web Application
for the Computer Engineering Department

Name: David Kwame Odoi-Anim

Student ID: 22312110

Course: CPEN 208 — Introduction to Software Engineering

Semester: Second Semester, 2025/2026

Lecturer: Mr. Asiamah

PostgreSQL

Next.js 14

TypeScript

Tailwind CSS

GitHub: <https://github.com/doxaodoi/project-1-2>

1. Overview

This project delivers a relational database for a software the Computer Engineering Department intends to build, plus a Next.js 14 web application. The five required items are implemented as **functionalities users perform**, split across a **student** role and a departmental **admin** role:

#	Functionality	Who	Action
1	Student personal information	Student	View record and edit contact details
2	Student fees payments	Student	View statement and make a payment
3	Course enrollment	Student	Register / drop current-semester courses
4	Lecturers to course assignment	Admin	Assign / remove a lecturer on a course
5	Lecturers to TA assignment	Admin	Assign / remove a TA under a lecturer

The admin also views the whole **class roster with each student's outstanding fees**, which is exactly what the required database function `finance.get_outstanding_fees()` produces. Students additionally see their grades and a read-only view of who teaches their courses.

1.1 Assumptions

- Database `coe_dept`, four schemas: `people`, `academic`, `finance`, `auth`.
- Sample data is the real CPEN 208 class roster (70 students); emails follow `<studentID>@st.ug.edu.gh`.
- Two terms are seeded: **Semester 1 2025/2026** completed (graded) and **Semester 2 2025/2026** current (registerable).
- Each student is billed three items totalling **GH¢12,300.00**; payments vary.
- Accounts: every student uses password `Student@123`; a department admin signs in with `admin@coe.ug.edu.gh` / `Admin@123`.

2. Database Design

Four schemas hold the tables; every relationship is enforced with a foreign key. The `auth.users` account links to a student (or is an admin, with a null student link).

people

programs

admins), full_name, email (unique), password_hash,
role

2.1 Build scripts (run in pgAdmin, in order)

`00_create_database` → `01_schemas` → `02_tables` → `03_functions` → `04_seed` (70 students, both terms, admin account) → `05_verify`. A database backup is included for one-step restore.

3. The Outstanding-Fees Function

The required function returns every student's `billed - paid` as a JSON array; the admin's Class & Fees screen is built on it.

```
CREATE OR REPLACE FUNCTION finance.get_outstanding_fees()
RETURNS JSON LANGUAGE sql STABLE AS $$
    SELECT COALESCE(json_agg(row_to_json(t) ORDER BY t.full_name), '[]'::json)
    FROM (
        SELECT s.student_id, s.full_name, s.email,
               COALESCE(b.total_billed,0) AS total_billed,
               COALESCE(p.total_paid,0) AS total_paid,
               COALESCE(b.total_billed,0) - COALESCE(p.total_paid,0) AS outstanding
        FROM people.students s
        LEFT JOIN (SELECT student_id, SUM(amount_due) total_billed
                   FROM finance.fee_bills GROUP BY student_id) b ON
        b.student_id=s.student_id
        LEFT JOIN (SELECT student_id, SUM(amount) total_paid
                   FROM finance.payments GROUP BY student_id) p ON
        p.student_id=s.student_id
        ) t;
    $$;
```

```
[ { "student_id":22312110, "full_name":"David Kwame Odoi-Anim",
    "total_billed":12300.00, "total_paid":9000.00, "outstanding":3300.00 } /* ...70
total */ ]
```

6. Non-Functional Requirements

Beyond the five functionalities, the software meets the quality requirements expected of a department system:

Category	How it is addressed
Security	BCrypt password hashing; stateless JWT (HS256); HttpOnly cookie; role-based access (STUDENT/ADMIN) plus per-record ownership checks; fully parameterized SQL (no injection); the database password is supplied via an environment variable and never committed.
Validation & error handling	Server-side validation (positive payments not exceeding the balance, required fields, valid semester); consistent JSON error responses with correct status codes (400/401/403/404/409).
Performance	Indexes on foreign-key/lookup columns; HikariCP connection pooling; a stateless API that scales horizontally; no-cache reads keep data fresh.
Reliability & integrity	Foreign-key and UNIQUE constraints; a transactional registration path; re-runnable, idempotent SQL scripts; a database backup is provided.
Usability & accessibility	Responsive layout; labelled form controls; clear success/error feedback; role-appropriate navigation.
Maintainability	Layered controller → service → repository design; DTO records; centralized configuration; small, single-purpose modules.
Portability	Standard PostgreSQL; environment-driven config with an <code>.env.example</code> ; runs locally without containers.

7. How to Run

1. **Database:** in pgAdmin run `00` on `postgres`, then `01 – 05` on `coe_dept` (or restore `coe_dept_backup.backup`).
2. **API (Project 2):** `cd "PROJECT 2/api"`, set `DB_PASSWORD`, `mvn spring-boot:run` (port 8080).
3. **Front end:** `cd "PROJECT 1/web"`, copy `.env.example` → `.env.local`, `npm install && npm run dev`, open `http://localhost:3000`.
4. Student: `22312110@st.ug.edu.gh` / `Student@123`. Admin: `admin@coe.ug.edu.gh` / `Admin@123`.

Deliverables: SQL scripts + backup in `PROJECT 1/database`; front-end source in `PROJECT 1/web`; full source on GitHub at <https://github.com/doxaodoi/project-1-2>.

Appendix — Running the Whole Stack with Docker

The entire system — database, API and frontend — is containerised so it can be started with a single command, with no local PostgreSQL, Java or Node installation required. From the submission root:

```
docker compose up --build
```

```
db (PostgreSQL) → api (Spring Boot :8080) → web (Next.js :3000)
```

What each service does

Service	Image / build	Role
db	postgres:16-alpine	On first start, automatically runs the Project 1 scripts <code>01_schemas</code> → <code>04_seed</code> to build and populate <code>coe_dept</code> .
api	built from <code>PROJECT 2/api</code>	Spring Boot service; reaches the database by the compose service name <code>db</code> .
web	built from <code>PROJECT 1/web</code>	Next.js 14 frontend; calls the API by the service name <code>api</code> . Open <code>http://localhost:3000</code> .

Composition (abridged `docker-compose.yml`)

```
services:
  db:
    image: postgres:16-alpine
    environment: { POSTGRES_DB: coe_dept, POSTGRES_PASSWORD: coe_dept_pw }
    volumes:
      - "/PROJECT 1/database/01_schemas.sql:/docker-entrypoint-initdb.d/01_schemas.sql:ro"
      - "/PROJECT 1/database/02_tables.sql:/docker-entrypoint-initdb.d/02_tables.sql:ro"
      - "/PROJECT 1/database/03_functions.sql:/docker-entrypoint-initdb.d/03_functions.sql:ro"
      - "/PROJECT 1/database/04_seed.sql:/docker-entrypoint-initdb.d/04_seed.sql:ro"
    healthcheck: { test: ["CMD-SHELL", "pg_isready -U postgres -d coe_dept"] }
  api:
    build: "/PROJECT 2/api"
    environment: { DB_URL: jdbc:postgresql://db:5432/coe_dept, DB_PASSWORD: coe_dept_pw }
  web:
    build: "/PROJECT 1/web"
    depends_on: { db: { condition: service_healthy } }
```

```
environment: { API_BASE_URL: http://api:8080 }  
depends_on: [api]
```

Why this matters (non-functional requirements)

- **Portability** — the system runs identically on any machine with Docker; no "works on my machine" setup drift.
- **Reproducibility** — the database is rebuilt deterministically from the same scripts every time, and `docker compose down -v` gives a clean slate.
- **Isolation & onboarding** — each tier runs in its own container on a private network; a new user is up and running with one command.

Sign in with the demo accounts documented earlier — student `22312110@st.ug.edu.gh` / `Student@123`, or admin `admin@coe.ug.edu.gh` / `Admin@123`.
